

An unexpected team ID was not a reason to delete.

Historical games referenced teams missing from the team table. I investigated the identifiers before removing valid history.

65,642

unique games retained in the canonical output

Historical sample, not a live NBA feed.

Separate valid history from duplicated rows.

1

53 historical team references

Explicit identifier references preserve valid relationships. They are not 53 current franchises.

2

155 duplicate keys quarantined

Duplicates are separated from accepted output across the six source files.

161,111 source rows → 160,956 accepted source rows.
Added references are logged separately.

Keep the decision open to inspection.

1

Versioned source and SQL

Six CSV sources, an explicit relational model and analytical views.

2

Reconciliation evidence

The isolated SQL check records 15 objects, 65 columns and zero orphan keys.

I document the accepted output, quarantine and reproduction steps alongside the report.
